METROPOLITAN INTELLIGENCE

UNUSUAL CONSULTATIONS BEFORE THE LORDS

From our own Reporter

Considerable curiosity has been occasioned in political and diplomatic circles by reports that certain persons claiming rank among the elder Fae lordships are expected to confer, within the coming month, with members of the House of Lords and other gentlemen connected with questions of administration, treaty, and ancient privilege.

No official notice has yet been issued, and it would be premature to state the purpose of these consultations with confidence. Those acquainted with such matters observe only that intercourse between Parliament and the older courts has seldom proceeded without some delicacy of language, precedence, and interpretation.

Several members privately express the hope that the affair shall remain one of ceremony rather than policy. Others, with less composure, predict an increase in those small confusions, verbal snares, and social misunderstandings commonly attributed to Fae diplomacy.

SCIENTIFIC AND MECHANICAL REVIEW

PROFESSOR INDIGO'S APPROACHING EXPERIMENT

From our Scientific Correspondent

Professor Ulysses Indigo, whose lectures upon the human brain have long attracted attention among physicians, natural philosophers, and students of galvanic theory, is understood to be preparing the public announcement of an experiment many years in development.

The nature of the demonstration has not been disclosed in full. Persons familiar with Professor Indigo's work describe it as concerned with the relation between memory, sensation, and the measurable operations of the nervous system. Whether the experiment is to be regarded chiefly as medical, philosophical, or mechanical remains a subject of lively speculation.

It is said that several invitations have already been issued to men of science and to patrons interested in the practical improvement of the human condition. More cautious observers remark that the brain is not a telegraph office, nor a municipal engine, and that the application of apparatus to so delicate an organ should be approached with becoming humility.

COURT AND SOCIETY

LORD PEMBROKE AT THE QUEEN'S BALL

From our Society Correspondent

Lord Edmund Pembroke was observed at the Queen's Ball this weekend in a particularly handsome new evening suit, understood to be the work of Messrs. Hargreaves & Sons. The tailoring was much admired, being at once sober in line and distinguished in finish.

His Lordship was, for some considerable portion of the evening, in the company of Miss Kate Vaughan, the celebrated actress and dancer, whose appearances upon the London stage have lately attracted much admiration. Their conversation, though conducted with perfect propriety, did not pass wholly without notice.

Whether society has discovered an attachment, or merely invented one, remains as yet a matter for the drawing-room. It will be recalled, however, that Lord Pembroke's patronage of the theatre has more than once drawn comment, though never formal censure.

METROPOLITAN INTELLIGENCE

POLICE DISCIPLINE AND UNUSUAL DISTURBANCES

From our own Reporter

Further discussion continues within metropolitan offices respecting the recent circular attributed to Commissioner Wessex, concerning the conduct of ordinary constables when required to act beside mechanical patrol apparatus during disturbances of an unusual character.

Officials insist that the instruction represents no extraordinary alarm, but only the prudent refinement of regulations in a city whose conditions grow more complicated by the month. Nevertheless, the circular has produced comment among those who believe the Metropolis is being asked to accept a new species of discipline shared between man and mechanism.

Several constables are said to welcome clearer instruction, particularly where electrical, chemical, or arcane circumstances may render ordinary courage insufficient. Others privately observe that no printed order can wholly prepare a man for occurrences which the public is later assured were nothing out of the common way.

FOREIGN INTELLIGENCE

UNEASY REPORTS FROM THE CONTINENT

From our Foreign Correspondent
Vienna, June 29

Correspondence from Vienna and Berlin continues to describe an atmosphere of watchfulness among continental governments. The effects of recent revolutionary violence remain plainly visible in administrative policy, particularly where railway stations, telegraph offices, and public assemblies are concerned.

Officials throughout Europe increasingly regard the modern city as an instrument requiring constant supervision. The rapid passage of persons and messages has made secrecy more difficult, but has also given rumour a speed once reserved for official dispatches.

Commercial men report no immediate disturbance of consequence, though caution remains the prevailing mood. In diplomatic circles it is observed that the present peace of Europe rests not only upon armies and ministries, but upon clerks, wires, police registers, and the prompt correction of public disorder.

COMMERCIAL REPORT

APPARATUS SHARES AND INSURANCE QUESTIONS

From our City Correspondent

Business in railway and engineering securities has proceeded steadily, though without marked enthusiasm. Companies connected with signalling apparatus, municipal regulation, and mechanical patrol fittings continue to attract attention from investors inclined toward the future management of the Metropolis.

Merchants generally express confidence that invention cannot be arrested, though several add that its risks ought not to be priced after the explosion, discharge, or public alarm has already occurred.

GENERAL NOTICES

SPORTING NOTICE

Mr. Jude Davies of the Mission Gym obtained a decisive victory last night in a single round of competition. His trainer, Mr. Peter Davies, described the winning blow as an uppercut of uncommon effect. Persons interested in the science of boxing may inquire at the Mission Gym.

LECTURE

At the Mechanics' Institution, Tuesday next: "The Brain, the Battery, and the Future of Medical Inquiry."
